2. Make changes in the checkin.py script

```python
class siteManager:
    def siteManagerInfo(self):
        address = ""
        account_sid = ''
        auth_token = ''
        twilioContact = ''
        emailLoginId = ""
        emailLoginPassword = ""
        return address,account_sid,auth_token,twilioContact,emailLoginId,
```

Navigate to class siteManager and to the method siteManagerinfo(), update the variables in the file. While registering on Twilio, manager will get a Twilio Contact number. Email ID and password required here is of the Gmail account used to send mails to guest and host.
